EXCLUSIVE DESIGN

2XREP

This new design is based upon a balance of electrolyte to active material. Specific gravity is slightly higher due to the increase of active material. Utilizing full positive and negative plates no special alloy is required.

No special charger is required to recharge the battery. A 15 - 20 AMP charger is adequate for full recharge.

Custom designs are available. Call your local representative for additional information or call Bulldog direct.

The "2XREP" battery is engineered for EV requirements so it is of an industrial design and manufactured for the golf cart battery physical size. This design allows for additional run time. The "2XREP" has twice the capacity and much longer life. Life expectancy is two years if properly maintained. Flip top vents are provided for easy watering and a multiple of terminal connections are available.

A common testimonial from existing users of the "2XREP" battery;

A Golf Course

"The "2XREP" battery by Bulldog is running 5-6 18 hole rounds of golf before they need charging. The battery does not seem to slow on steep inclines. The batteries I used before made only 2-3 18 hole rounds of golf and would substantially slow down on inclines."

School Bus Manufacturer

I have had these units for several months now and they are doing exceptionally well in our outdoor sky jack. I have no problems pulling on level ground or hills. These batteries do not Boil over and they stay charged. I am very satisfied with these units.

Volvo Cars of America Parts Division

I am getting twice the run time compared to the conventional golf cart batteries in our Taylor Dunn double stack parts pickers. I have replaced the batteries in several units with the "2XREP" battery. I plan to update all of my units with the "2XREP" battery.

Macy's Logistics & Operation - (1,000,000 + sq ft facility)

The maintenance Supervisor, "I am getting triple the run time on my electric maintenance vehicles with no loss of power on any of the long runs or ramps."
